

Disconnect the fiber optic cable and reset the router

AI Overview

To safely disconnect a fiber optic cable and reset your router, power off the device, carefully remove the fiber cable, and perform a factory reset using the router's reset button. Disconnecting the Fiber Optic Cable Fiber optic cables are delicate and transmit data using light, so careful handling is essential to avoid damage or injury . Follow these steps: Power off the router or modem – Unplug the power adapter to eliminate any risk from the laser light inside the fiber cable . Identify the connector type – Common home connectors include SC and SC/APC, which have push/pull latching mechanisms . Remove the cable carefully – Apply light, steady pressure along the connector axis to release it. Avoid twisting, bending, or pulling the cable itself . Cap the connectors – Place protective end caps on any exposed ports to prevent contamination or damage . Inspect for damage – If the connector is stuck, damaged, or recessed, contact your ISP or a certified technician . Resetting the Router After safely disconnecting the fiber cable, you can reset your router to resolve software or configuration issues : Locate the reset button – Usually a small recessed button on the back or underside of the router . Power off the router – Unplug the power cord and wait at least 10–30 seconds . Press and hold the reset button – Use a paperclip or pin for 10–30 seconds until the router restarts and lights blink . Power on the router – Plug the power back in while holding the reset button if required, then release after the specified time . Reconfigure network settings – Log in to the router's admin panel to re-enter ISP credentials, Wi-Fi SSID, and password if needed . Additional Tips Check the LOS light – If the Loss of Signal (LOS) light blinks red, ensure all cables are securely connected and undamaged . Wait for stabilization – Allow a few minutes for the router to fully reboot and for indicator lights to stabilize before testing the connection . Pre...
