

Do you use fiber optic splitters in the computer room

Overview

When employing the first-level splitting method in a residential network, optical splitters offer flexibility for indoor or outdoor installation. Indoor options encompass locations like the community's central computer room, building's weak current well, or floor wiring box. Unlike active devices (which require power), splitters operate without electricity, relying solely on the physics of. Instead of Ethernet cables, routers and switches, a passive optical LAN relies on singlemode fiber, passive optical splitters, optical line terminals (OLTs) and optical network terminals (ONTs). A POLAN shifts all network intelligence to an OLT and all device management to an ONT. These devices help you control light signals well. ; tray-type optical splitters are generally used for ODF optical fiber distribution frames and optical cable transfer boxes in the computer room; rack-mounted optical splitters are installed in standard racks;.
