

Grounding wire between distribution box and enclosure

Overview

26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. Grounding an electrical panel is an important step to keep your home and family safe. However, it is always easy to overlook grounding aspects, or to fix them incorrectly. It establishes a dedicated, low-resistance return path for stray electrical current, preventing dangerous voltage from building up on conductive surfaces. Here's why it matters: Static discharge: Metal doors can build up static charge, especially in high-voltage environments. 7 Provide conduit grounding bushings, bonded together and connected to the equipment enclosure on all incoming and outgoing conduits on distribution switchgear and switchboards, distribution panels and on all conduits over 1-1/4" diameter at all panelboards, pull boxes and equipment.

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

Connect the conductor from the panel ground bus or connector at the source to all items to which the conduits or raceways connect. Bond to a ground lug within each panel, box or equipment.

9 Recommended Practices for Grounding

Use equipment grounding conductors sized equal to the phase conductors to decrease circuit impedance and improve the clearing time of

Does the Distribution Box Door Need Grounding? Safety Standards FAQ

Choose a dedicated grounding screw or clip —not a reused bolt or hinge. Run a separate copper wire (usually 12 AWG) from the door to the cabinet's grounding bar.
