

How is the Monaco fiber optic cable distributed to users homes

AI Overview

Monaco's fiber optic network is delivered to homes through a combination of horizontal street-level cabling and vertical in-building connections managed by Monaco Telecom. Network Deployment Monaco Telecom completed the installation of 210 kilometres of fiber optic cables across the Principality, replacing the old copper network and providing high-speed internet to all residents and businesses . The deployment involves two main stages:

- Horizontal deployment:** Fiber cables are laid along streets and public areas to reach buildings. This stage establishes the backbone of the network and ensures coverage across the entire country .
- Vertical deployment:** Once the horizontal network reaches a building, technicians install fiber lines inside the building to connect individual apartments or offices. This requires authorization from building trustees and is done progressively for each residence .

Connection to Homes Each household is connected to the fiber network through on-site interventions by Monaco Telecom technicians. The process includes:

- Installing a fiber termination point inside the apartment or home.
- Connecting the fiber line to a modem or optical network terminal (ONT) provided by Monaco Telecom.
- Configuring the home network to enable high-speed internet access, often with optimized WiFi coverage to overcome obstacles like thick walls in older buildings .

The transition from copper to fiber is gradual but free of charge, and residents are encouraged to contact Monaco Telecom to activate their fiber connection . By 2022, the rollout aimed to make 100% of households eligible for fiber, with full retirement of the copper network completed by 2024 .

Benefits The fiber-to-the-home (FTTH) network provides:

- Extremely high speeds up to 10 Gbps.
- Stable and reliable connectivity, reducing WiFi dead spots.
- Energy efficiency compared to copper, as fiber consumes...
