

# How to connect TX and RX fiber optic switches

## Overview

A fiber-optic link can function only if Tx on one end is connected to Rx on the other, and vice versa; this is accomplished by creating a fiber polarity flip that swaps Tx for Rx at some point in the link. For duplex transmission, this is relatively straightforward. One of the most common problems in fiber optic networks is the misalignment of the transmit (TX) and receive (RX) pairs. A link's transmit signal (Tx) must match its corresponding receiver (Rx) at the other end. Although it may seem obvious, fiber optic polarity is a frequent source of confusion and. Your Fiber cabling is complete and you've inserted brand-new SFPs, cleaned the connectors, and used what looks like a perfect fiber patch cable. yet the link LEDs stay red or amber. In fiber optics, data travels from the Tx port of one device to the Rx port of another, forming a two-way communication path.
