

How to remove the fiber optic cable from the junction box

AI Overview

Proper removal and installation of a fiber optic junction box ensures network reliability, protects delicate fibers, and maintains signal integrity.

Preparation and Safety Before starting, gather all necessary tools: screwdrivers, drill, dowels, cable strippers, fiber cleaver, and testing equipment such as an OTDR or power meter (). Ensure the work area is clean, dry, and free from dust or moisture. Always handle fiber optic cables carefully, avoiding sharp bends or excessive tension, as fibers are fragile and can break easily ().

Removal of Existing Junction Box

Power Down and Disconnect: Ensure the network is inactive and disconnect all incoming and outgoing fiber connections.

Open the Box: Remove the cover carefully, noting the arrangement of splices, adapters, and connectors.

Document Connections: Label each fiber strand to maintain proper routing during reinstallation.

Detach the Box: Unscrew the mounting screws and remove the box from the wall, rack, or pedestal. Avoid pulling on the fibers themselves ().

Installation of a New Junction Box

Select Location: Choose a location close to the fiber transfer point, protected from direct sunlight, moisture, and easily accessible for future maintenance ().

Mount the Box: Mark drill holes using a level, drill, insert dowels, and secure the box with screws. For rack-mounted or outdoor boxes, follow manufacturer-specific mounting instructions ().

Prepare the Fiber Cable: Carefully strip the outer sheath without damaging the fibers. Maintain the minimum bend radius to prevent signal loss ().

Connect Fibers: Insert fibers into the designated ports, splice or patch according to the box type, and secure them in splice trays or adapters. Ensure proper alignment to maintain signal integrity ().

Cable Management: Wind excess fiber neatly to avoid entanglement and maintain the standard bend radius. Use cable ties or guides as needed ().
