

Huawei switch optical port configuration

v

AI Overview

Huawei switch optical ports can be configured and monitored using CLI commands to enable ports, assign VLANs, and check transceiver status and power levels. Accessing and Enabling Optical Ports To configure an optical port, first access the switch via console, SSH, or Telnet. Enter system view mode using the system-view command. Navigate to the target optical interface, for example: `CodeCopy interface GigabitEthernet 0/0/1` Activate the port with: `CodeCopy undo shutdown` This enables the port for data transmission. For security and traffic management, apply port security and rate limiting: `CodeCopy port-security enable` `port-security mac-address sticky` `qos lr outbound cir 100000` Assign the port to a VLAN as an access port: `CodeCopy port link-type access` `port default vlan 10` Always save the configuration with `save` to retain changes after a reboot . Viewing Optical Module Information Huawei switches allow you to monitor optical transceivers using the `display transceiver` command. To view all optical ports: `CodeCopy display transceiver` For a specific port: `CodeCopy display transceiver interface GigabitEthernet 0/0/1` To see detailed receive (Rx) and transmit (Tx) power information, use the verbose option: `CodeCopy display transceiver interface GigabitEthernet 0/0/1 verbose` This provides information such as transceiver type, connector type, wavelength, transfer distance, vendor, serial number, and digital diagnostic monitoring parameters including RX Power and TX Power . Binding Optical Ports to VLANs To bind multiple optical ports to a VLAN, use the interface range command: `CodeCopy interface range GigabitEthernet 0/0/1 to 0/0/4` `port link-type access` `port default vlan 1` This allows simultaneous configuration of multiple ports, simplifying VLAN assignment and management . Best Practices Monitor optical power levels regularly to detect potenti...
