

Installation process of electrical distribution box and cable tray

AI Overview

Proper installation of an electrical distribution box with cable trays requires careful planning, alignment, secure support, and adherence to safety and regulatory standards.

Planning and Preparation Before installation, review approved shop drawings to determine the layout, length, and location of cable trays and distribution boxes in the building. Ensure all materials, including cable trays, ladders, fittings, and the distribution box, are inspected for damage and approved for use. Mark the cable tray routes from the SMDB (Sub Main Distribution Board) and metering panels to the designated locations. Coordination with other services is essential to avoid conflicts.

Material Handling and Storage Store cable trays, ladders, and accessories horizontally on flat surfaces with timber supports at intervals of about 1 meter, and cover them to protect from moisture and sunlight. Use scaffolding or other safe working platforms for elevated installations. Ensure all tools, such as drills, screwdrivers, and measuring tapes, are available and in good condition.

Installation of Cable Trays

Mounting Supports: Use GI threaded rods (10mm for trays below 300mm, 12mm for above 300mm) fixed to ceiling slabs or walls. Install GI slotted C-channels (41x41x2 mm) on the rods using nuts and washers.

Tray Alignment: Install cable trays on the channels, ensuring they are straight, level, and securely fastened. Complete each tray run before installing cables.

Fittings and Accessories: Use bends, tees, and other fittings of the same quality as the tray. Provide adequate spacing for cable entry and maintenance.

Fire and Safety Measures: Where trays pass through fire-rated walls, provide fire stopping to maintain ratings. Install earth link straps between tray lengths to ensure electrical continuity.

Distribution Box Integration Position the electrical distribution box at a convenient location along the...
