

Integrated Reactor for Medium Frequency Power Supply

Overview

Standard design is intended for detuned capacitor banks. Reactors have high linearity, low losses and minimal noise. An SVC normally consists of a combination of: Thyristor-Controlled Reactors (TCR), Thyristor-Switched Capacitors and Reactors (TSC and TSR), Mechanically-Switched Capacitor banks and Harmonic Filters (HF).

Damping Reactor This reactor is series connected with one or more capacitor banks to. For more than 50 years, GE Vernova has supplied a broad range of reactors to markets around the world. With proven industry expertise, stringent quality controls, first class materials and full international compliance, GE Vernova's reactors are designed to meet a wide variety of customer needs. GE. Shunt reactors and series reactors are used widely in AC networks to limit overvoltage or shortcut current in power transmission. The percentage tuning. The invention discloses a high-power medium-frequency power supply device. The high-power medium-frequency power supply device comprises a three-phase inlet wire electric reactor, a three-phase full-bridge controllably rectification circuit, a filter capacitor, a medium-frequency inversion main. es interested in SMRs.
