

Reconnect the fiber optic router and configure it

AI Overview

Reconnect your fiber optic cable via the ONT, then configure your router using ISP credentials and proper network settings for optimal performance.

Step 1: Prepare Equipment Ensure you have the following:

- Fiber optic cable (SC/APC or SC/UPC connectors)
- Optical Network Terminal (ONT) provided by your ISP
- Router compatible with fiber input (WAN or SFP port)
- Ethernet cable to connect ONT to router
- Power adapters for both ONT and router

Step 2: Reconnect the Fiber Optic Cable Locate the fiber wall outlet where the ISP line enters your home. Handle the fiber cable carefully; avoid touching the glass tip. Remove protective caps from both the cable and ONT port. Align the connector using the key/tab and insert until it clicks securely. Power on the ONT and wait 2-5 minutes for status lights to stabilize.

Step 3: Connect ONT to Router Use an Ethernet cable to connect the ONT's LAN/Ethernet port to the router's WAN port. Power on the router after the ONT is fully operational. Ensure both devices are placed in a dry, ventilated area near power outlets, ideally with surge protection.

Step 4: Configure Router Settings Access the router's admin panel via a web browser (commonly 192.168.0.1 or 192.168.1.1). Enter ISP credentials (PPPoE username/password or DHCP settings) as provided. Update router firmware to the latest version for compatibility and security. Set Wi-Fi network name (SSID) and strong password. Enable Quality of Service (QoS) if you use VoIP, video calls, or gaming to prioritize traffic. Adjust WAN connection type or DHCP settings according to ISP requirements.

Step 5: Verify Connection Check ONT lights: Power should be solid green; PON or fiber light indicates active connection. Check router indicators: WAN/Internet light should confirm connectivity. If connection fails, power cycle the ONT first, then the router to refresh the network handshake.

Step 6: Optimize Place...
