

South Africa cuts fiber optic cable

Overview

A major undersea fibre-optic cable cut on Sunday disrupted internet services across East Africa, slowing connections and causing widespread outages in the region and South Africa. The recent disruptions to South Africa's underwater internet cables have significantly affected internet access across the country. The crew of the *Léon Thévenin* maintains one stretch of this global network. A snapped cable can disconnect millions until it is fixed by a repair ship. Two cables linking Europe to the Middle East and Asia have been reportedly cut in the Red Sea, affecting internet connections. Today, more than 95% of international data traffic flows through subsea cables, making them as critical to modern economies as air routes, ports, and energy pipelines.
