

What switch should be used for the 254 monitoring aggregation point

Overview

The TAP aggregation switch is directly connected to all of the analysis tools used to monitor the events in the network fabric. These monitoring devices include remote monitor (RMON) probes, application firewalls, IPS devices, and packet sniffer tools. Multiple physical Ethernet ports are bundled into a logical interface (called Port-Channel on Cisco or Eth-Trunk). An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. EtherChannel (also called Port-Channel) is a port link aggregation technology that bundles multiple physical Ethernet links into one logical link between two switches or between a switch and a server. Out-of-band Usage monitoring requires that your switch is capable of port mirroring and that a mirror source and a mirror destination (also known as Switched Port Analyzer (SPAN) ports) have been. Link aggregation — standardized under IEEE 802. Increased bandwidth by combining multiple links. The following list details the basic.
