

Wireless connection to KVM switcher with two inputs and two outputs

AI Overview

You can achieve a wireless connection to a 2-input, 2-output KVM switch using models with built-in Wi-Fi or by combining a USB switch with multi-device wireless keyboards and mice.

Wireless KVM Options

Built-in Wi-Fi KVM Switches Some KVM switchers, like the PFY 4K 4x2 HDMI Matrix Switcher with KVM, include dual-band Wi-Fi modules that allow wireless control of connected computers. This switch supports two HDMI inputs and outputs, USB-B and USB-A KVM ports for keyboard/mouse control, and can be managed via RS-232, LAN, or front panel buttons. Using such a device, you can control two computers across two monitors without running long USB cables.

Wireless Peripherals with USB Switch If your KVM switch does not have built-in Wi-Fi, you can use a dual-mode keyboard and mouse that support Bluetooth and 2.4 GHz wireless connections. Connect the keyboard and mouse to a USB switch, which then connects to both computers. Switching control is done via the USB switch button, while the monitors are toggled using the KVM's input selection. This method is cost-effective but may require manual switching of monitor inputs.

Dual-Monitor Considerations Each computer must have two video outputs to support dual monitors through the KVM. The KVM switch should support extended or mirrored display modes to maintain consistent desktop layouts across both computers. Ensure your wireless peripherals are compatible with the KVM's USB ports and that latency is acceptable for your workflow.

Practical Tips

Check compatibility: Verify that your computers' graphics cards support dual outputs and the KVM supports the desired resolution (e.g., 4K@60Hz).

Minimize interference: Use 5 GHz Wi-Fi or 2.4 GHz with minimal congestion to reduce latency.

Consider hybrid setups: Some setups combine wired video with wireless USB control for reliability and flexibility.
